

HOLMAN NOW LETS YOU WaterSmart™ FROM YOUR RAINWATER TANK!

WaterSmart™ Low Pressure Drip Line

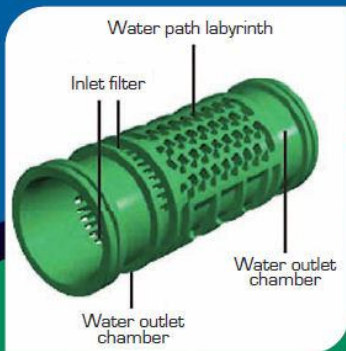

Unlike conventional sprinkler systems, the WaterSmart™ Low Pressure Drip Line distributes water from your rainwater tank using low pressure drippers (inside the tube) so water only goes where it's needed. Pair it with a Holman tap timer, and you can create an automatic drip system that is designed to work at low pressure, without a pump, directly from a rainwater tank.

- EASY DIY INSTALLATION
- AUTOMATE USING A HOLMAN TAP TIMER
- USE STANDARD 13MM POLY FITTINGS

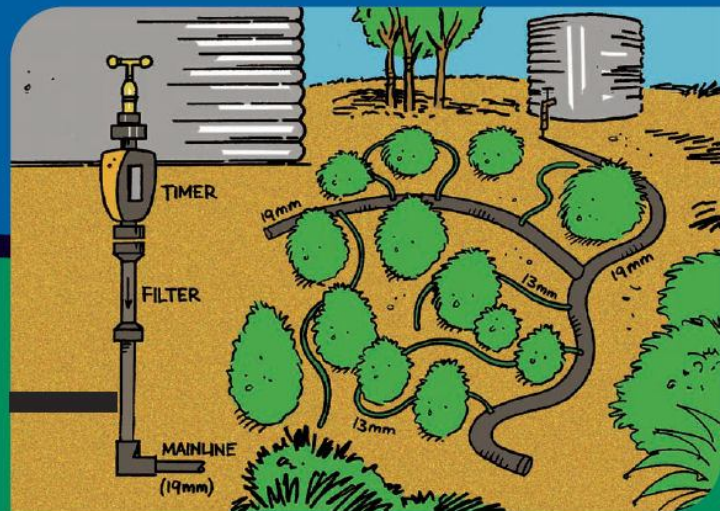

HOW IT WORKS

- COMPLIES WITH WATER RESTRICTIONS
- PLACE ABOVE GROUND OR UNDER MULCH FOR WATERING TREES, PLANTS AND VEGETABLE GARDENS
- SAVES WATER
- REDUCES EVAPORATION

HOW TO INSTALL

WaterSmart is a 13mm (ID) dripline equipped with a 'Super Typhoon' dripper that's installed during manufacture. No additional nozzles are required.

WaterSmart's unique dripper is designed to run off low pressure water sources like rainwater tanks without the need for a pump. WaterSmart delivers a uniform water application and achieves substantial water savings.

For automatic watering use Holman's Rain Tank Tap Timer.

- 1 Simply lay WaterSmart Dripline on top of the ground you wish to water. For large areas, connect multiple lengths of dripline as required with 13mm poly joiners.
- 2 Insert a 13mm barbed inline filter into the WaterSmart Dripline where it meets the tap of the water tank. Connect the dripline to your water tank with a standard tap fitting.
- 3 Slowly turn on the tap, and once water appears at the other end of the WaterSmart Dripline, turn off the tap and install a 13mm end plug.
